1	Using, linux-terminal or Windows-cmd, execute following networking commands and note the output: ping, traceroute, netstat, arp, ipconfig, Getmac, hostname, NSLookUp, SystemInfo	20/12/23	
2	Using Packet Tracer, create a basic network of two computers using appropriate network wire through Static IP address allocation and verify connectivity	03/01/24	
3	Using Packet Tracer, create a basic network of one server and two computers using appropriate network wire. Use Dynamic IP address allocation and show connectivity	10/01/24	
4	Using Packet Tracer, create a basic network of one server and two computers and two mobile / movable devices using appropriate network wire. And verify the connectivity	24/01/24	
5	Using Packet Tracer, Implement Static Routing, create a network with three routers with and each router associated network will have minimum three PC. Show Connectivity	07/02/24	
6	Using Packet Tracer, Implement RIP, create a network with three routers with and each router associated network will have minimum three PC. Show Connectivity	21/02/24	
7	Using Packet Tracer, create a network and implement Simple Area and MultiArea OSPF. Show Connectivity	28/02/24	
8	Using Packet Tracer, create a network with three routers with BGP and each router associated network will have minimum three PC. Show Connectivity	13/03/24	

Practical No 1

Aim: Using, linux-terminal or Windows-cmd, execute following networking commands and note the output: ping, traceroute, netstat, arp, ipconfig, Getmac, hostname, NSLookUp, SystemInfo

Theory:

- 1) **ping:** ping is a computer network administration software utility used to test the reachability of a host on an Internet Protocol network. It is available for virtually all operating systems that have networking capability, including most embedded network administration software
- 2) **traceroute:** The traceroute command (tracert) is a utility designed for displaying the time it takes for a packet of information to travel between a host system and the final destination system. This command returns a list of the hops that the data packets take along their path along their way to the destination
- 3) **netstat:** The netstat provides statistics about all active connections so you that we can find out which computers or networks a PC is connected to
Some of the netstat commands commonly used are
 - i) netstat -in command
This netstat function shows the state of all configured interfaces.
 - ii) netstat -a command
The netstat -a command shows the state of all sockets.
 - iii) netstat -s
The netstat -s command shows statistics for each protocol (while the netstat -p command shows the statistics for the specified protocol).
- 4) **arp:** The ARP (Address Resolution Protocol) commands are used to view, display, or modify the details/information in an ARP table/cache.
Some of the common arp commands are as follows
 - i) arp -a: This command is used to display the ARP table for a particular IP address. It also shows all the entries of the ARP cache or table.
- 5) **ipconfig:** ipconfig (Internet Protocol CONFIGuration) is used to display and manage the IP address assigned to the machine. In Windows, typing ipconfig without any parameters displays the computer's currently assigned IP, subnet mask and default gateway addresses.

- 6) getmac: Getmac is a Windows command used to display the Media Access Control (MAC) addresses for each network adapter in the computer.
- 7) hostname: A hostname is a label that is assigned to a device connected to a computer network and it is used to identify the device.
- 8) NSlookup: Using this command we can find the corresponding IP address or domain name system record. The user can also enter a command for it to do a reverse DNS lookup and find the host name for an IP address that is specified.
- 9) SystemInfo: This command is use to display detailed configuration information about a computer and its operating system, including operating system configuration, security information, product ID, and hardware properties

Commands

1. ping google.com
2. tracert google.com
3. netstat -in
netstat -a
netstat -s
4. arp -a
5. ipconfig
6. getmac
7. hostname
8. nslookup google.com
9. systeminfo

Short Explanation \for viva

1. ping google.com: Checks connectivity to Google's servers.
2. tracert google.com: Traces the route packets take to reach Google's servers.
3. netstat -in: Displays network interfaces and their statistics.
netstat -a: Shows all active network connections.
netstat -s: Provides network statistics, such as packet counts.
4. arp -a: Displays the ARP (Address Resolution Protocol) cache.
5. ipconfig: Shows IP configuration details for the system.
6. getmac: Retrieves the MAC (Media Access Control) addresses of network adapters.
7. hostname: Displays the computer's hostname.
8. nslookup google.com: Resolves and displays the IP address of Google's domain.
9. systeminfo: Provides detailed information about the system.

These commands are commonly used for network troubleshooting and system information gathering.

Practical No 2

Aim: Using Packet Tracer, create a basic network of two computers using appropriate network wire through Static IP address allocation and verify connectivity

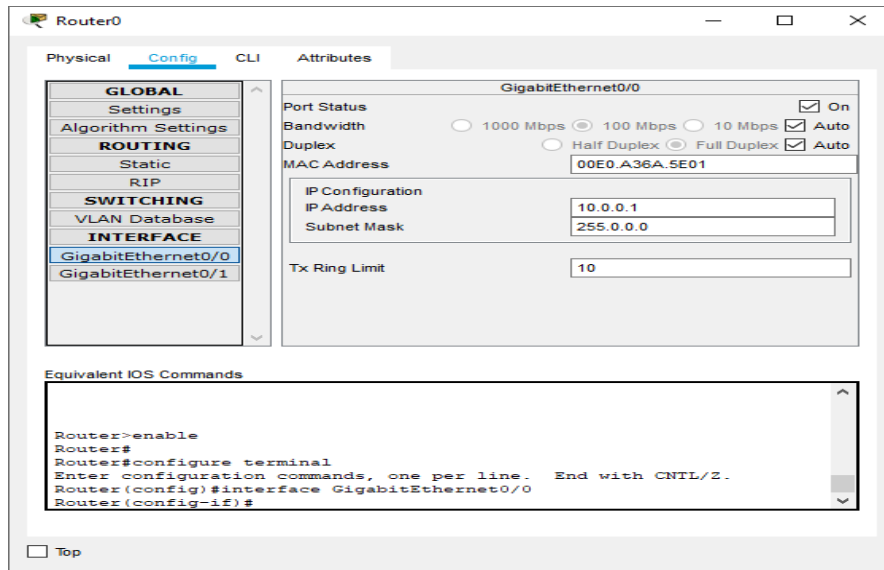

Theory:

We use the following network to verify the connectivity using Cisco packet tracer

Name	IP ADDRESS	DEFAULT GATEWAY
PC0	10.0.0.4	10.0.0.1
PC1	10.0.0.3	10.0.0.1
PC2	10.0.0.2	10.0.0.1
Router0	GigabitEthernet 0/0 =>10.0.0.1	

Configure the Router 0:

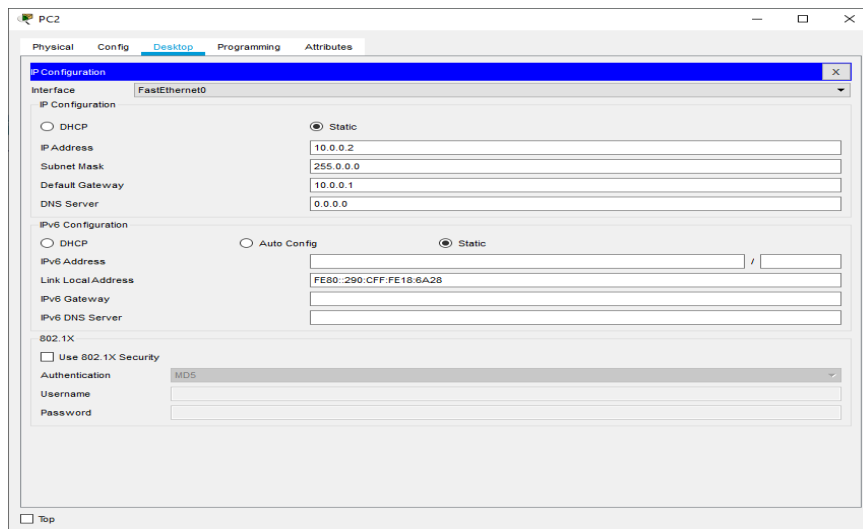

The Router0 configuration window is shown with the 'Config' tab selected. On the left, a tree view lists configuration categories: GLOBAL, Settings, Algorithm Settings, ROUTING, Static, RIP, SWITCHING, VLAN Database, and INTERFACE. Under INTERFACE, 'GigabitEthernet0/0' is selected. The main area displays settings for 'GigabitEthernet0/0'. The 'Port Status' is 'On'. 'Bandwidth' is set to '100 Mbps'. 'Duplex' is set to 'Full Duplex'. The 'MAC Address' is '00E0.A36A.5E01'. The 'IP Configuration' section shows 'IP Address' as '10.0.0.1' and 'Subnet Mask' as '255.0.0.0'. The 'Tx Ring Limit' is '10'. Below the settings, a text box titled 'Equivalent IOS Commands' contains the following commands:

```
Router>enable
Router#
Router#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)#interface GigabitEthernet0/0
Router(config-if)#
```

A 'Top' button is located at the bottom left of the window.

Configure PC2:

The PC2 configuration window is shown with the 'Desktop' tab selected. A 'IP Configuration' dialog box is open, showing settings for the 'FastEthernet0' interface. The 'IP Configuration' section has 'Static' selected. The 'IP Address' is '10.0.0.2', 'Subnet Mask' is '255.0.0.0', 'Default Gateway' is '10.0.0.1', and 'DNS Server' is '0.0.0.0'. The 'IPv6 Configuration' section has 'Static' selected. The 'IPv6 Address' is 'FE80::290:CFF:FE18:6A28', 'Link Local Address' is 'FE80::290:CFF:FE18:6A28', 'IPv6 Gateway' is empty, and 'IPv6 DNS Server' is empty. The '802.1X' section has 'Use 802.1X Security' unchecked. The 'Authentication' dropdown is set to 'MD5'. The 'Username' and 'Password' fields are empty. A 'Top' button is located at the bottom left of the window.

Configure PC1:

The screenshot shows the 'PC1' configuration window with the 'Desktop' tab selected. The 'IP Configuration' section is expanded, showing the 'FastEthernet0' interface. The 'IP Configuration' group has 'Static' selected. The fields are filled with: IP Address: 10.0.0.3, Subnet Mask: 255.0.0.0, Default Gateway: 10.0.0.1, and DNS Server: 0.0.0.0. The 'IPv6 Configuration' group has 'Static' selected, with fields for IPv6 Address, Link Local Address (FE80::2E0:F9FF:FE56:807B), IPv6 Gateway, and IPv6 DNS Server. The '802.1X' section has 'Use 802.1X Security' unchecked, and 'Authentication' set to 'MD5'. There are fields for Username and Password. A 'Top' button is at the bottom left.

Configure PC0:

The screenshot shows the 'PC0' configuration window with the 'Desktop' tab selected. The 'IP Configuration' section is expanded, showing the 'FastEthernet0' interface. The 'IP Configuration' group has 'Static' selected. The fields are filled with: IP Address: 10.0.0.4, Subnet Mask: 255.0.0.0, Default Gateway: 10.0.0.1, and DNS Server: 0.0.0.0. The 'IPv6 Configuration' group has 'Static' selected, with fields for IPv6 Address, Link Local Address (FE80::20B:BEFF:FE66:7D3A), IPv6 Gateway, and IPv6 DNS Server. The '802.1X' section has 'Use 802.1X Security' unchecked, and 'Authentication' set to 'MD5'. There are fields for Username and Password. A 'Top' button is at the bottom left.

Next, we type the commands in PC0 ping 10.0.0.3

```
C:\>ping 10.0.0.3

Pinging 10.0.0.3 with 32 bytes of data:

Reply from 10.0.0.3: bytes=32 time<1ms TTL=128
Reply from 10.0.0.3: bytes=32 time<1ms TTL=128
Reply from 10.0.0.3: bytes=32 time<1ms TTL=128
Reply from 10.0.0.3: bytes=32 time<1ms TTL=128

Ping statistics for 10.0.0.3:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
    Approximate round trip times in milli-seconds:
        Minimum = 0ms, Maximum = 1ms, Average = 0ms

C:\>arp -a

Internet Address      Physical Address      Type
10.0.0.3              00e0.f956.807b       dynamic

C:\>
```

Practical No 3

Aim: Using Packet Tracer, create a basic network of one server and two computers using appropriate network wire. Use Dynamic IP address allocation and show connectivity

Theory:

For assigning ip addresses dynamically we use the DHCP protocol

Dynamic Host Configuration Protocol (DHCP) is a client/server protocol that automatically provides an Internet Protocol (IP) host with its IP address and other related configuration information such as the subnet mask and default gateway.

The DHCP server maintains a pool of IP addresses and leases an address to any DHCP-enabled client when it starts up on the network. Because the IP addresses are dynamic (leased) rather than static (permanently assigned), addresses no longer in use are automatically returned to the pool for reallocation.

DHCP provides the following benefits.

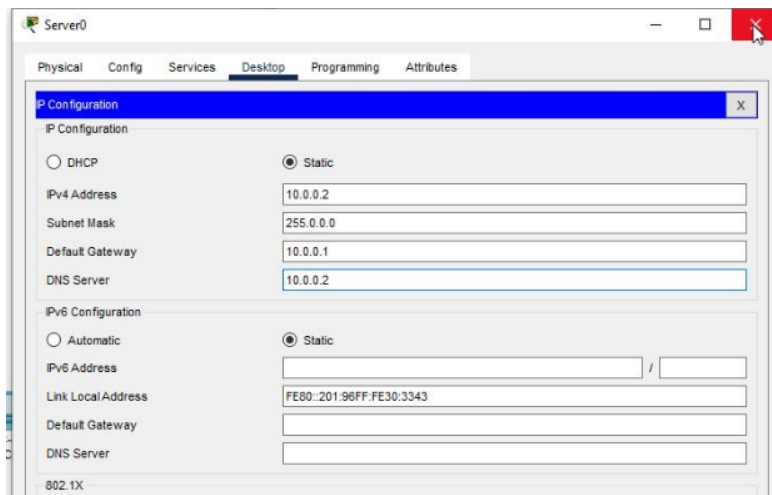

- 1) Reliable IP address configuration. DHCP minimizes configuration errors caused by manual IP address configuration, such as typographical errors, or address conflicts caused by the assignment of an IP address to more than one computer at the same time.
- 2) Reduced network administration. DHCP includes the following features to reduce network administration

DHCP runs at the application layer of the Transmission Control Protocol/IP (TCP/IP) stack to dynamically assign IP addresses to DHCP clients and to allocate TCP/IP configuration information to DHCP clients. This includes subnet mask information, default gateway IP addresses and domain name system (DNS) addresses.

We use the following topology for the present case

Configuring the Server:

Enabling and setting the DHCP Service on the Server:

The screenshot shows the 'Server0' configuration window with the 'Services' tab selected. The 'DHCP' service is enabled (Service: On). The configuration details are as follows:

Interface	Pool Name	Default Gateway	DNS Server	Start IP Address	Subnet Mask	Maximum Number of Users	TFTP Server	WLC Address
FastEthernet0	serverPool	10.0.0.1	10.0.0.2	10.0.0.3	255.0.0.0	512	0.0.0.0	0.0.0.0

Buttons: Add, Save, Remove

Verifying the Dynamic Addressing on both the PCs:

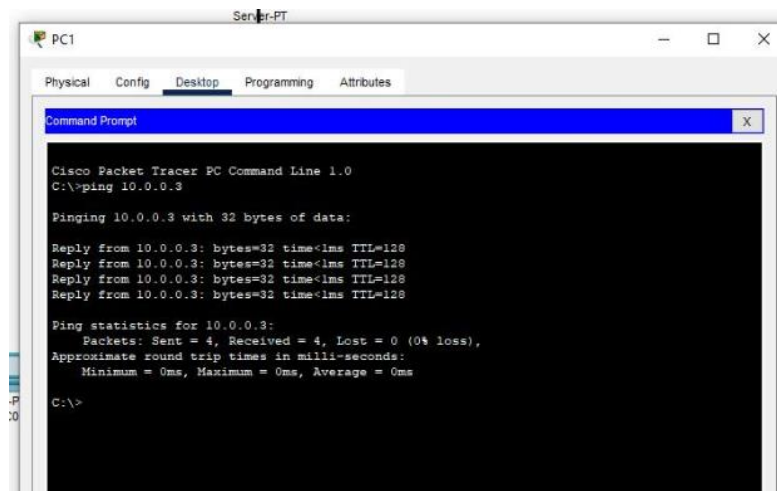

The screenshot shows the 'PC0' configuration window with the 'Desktop' tab selected. The 'IP Configuration' section is expanded, showing the following settings:

Interface	IP Configuration	IPv4 Address	Subnet Mask	Default Gateway	DNS Server
FastEthernet0	DHCP	10.0.0.3	255.0.0.0	10.0.0.1	10.0.0.2

IPv6 Configuration: Automatic (selected), IPv6 Address, Link Local Address (FE80::260:5CFF:FE65:CD24), Default Gateway, DNS Server.

Checking the connectivity:

Result:

Hence the Connectivity between the PCs has been verified.

Link for the video demonstration of the practical:

https://youtu.be/Jnj8c_15AiE

Practical No 4

Aim: Using Packet Tracer, create a basic network of one server and two computers and two mobile / movable devices using appropriate network wire. And verify the connectivity

Theory:

A Wireless Access Point (WAP) is a networking device that allows wireless-capable devices to connect to a wired network. Instead of using wires and cables to connect every computer or device in the network, installing WAPs is a more convenient, more secure, and cost-efficient alternative.

Setting up a wireless network provides a lot of advantages and benefits for you and your small business.

- 1) It is easier to set up compared to setting up a wired network.
- 2) It is more convenient to access.
- 3) It is less complicated to add new users in the network.
- 4) It gives users more flexibility to stay online even when moving from one area in the office to another.
- 5) Guest users can have Internet access by just using a password.
- 6) Wireless network protection can be set up even if the network is visible to the public by configuring maximum wireless security.
- 7) Segmentation of users, such as guests and employees, is possible by creating Virtual Local Area Networks (VLANs) to protect your network resources and assets.

There are different purposes of setting up a wireless network using a WAP.

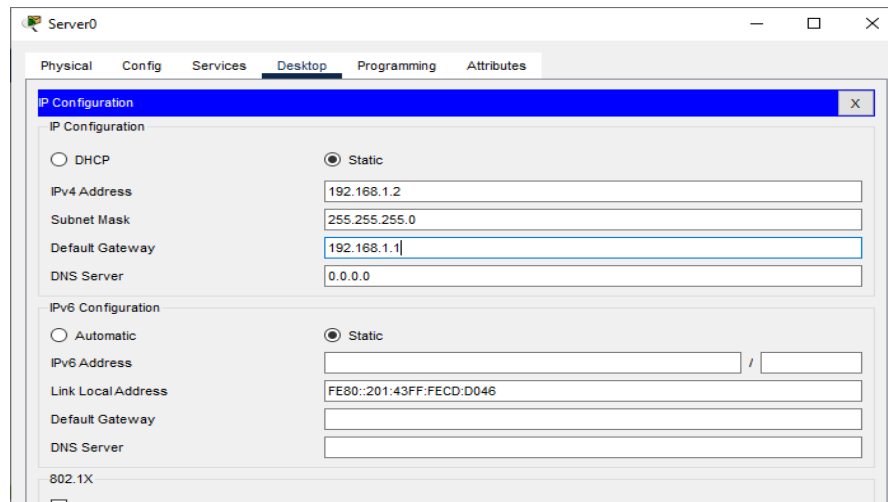

With a WAP, the following can be done:

- 1) Create a wireless network within your existing wired network.
- 2) Extend the signal range and strength of your wireless network to provide complete wireless coverage and get rid of dead spots especially in larger office spaces or buildings.
- 3) Accommodate wireless devices within a wired network.
- 4) Configure the settings of your wireless access points in one device.

For the present case we use the following topology

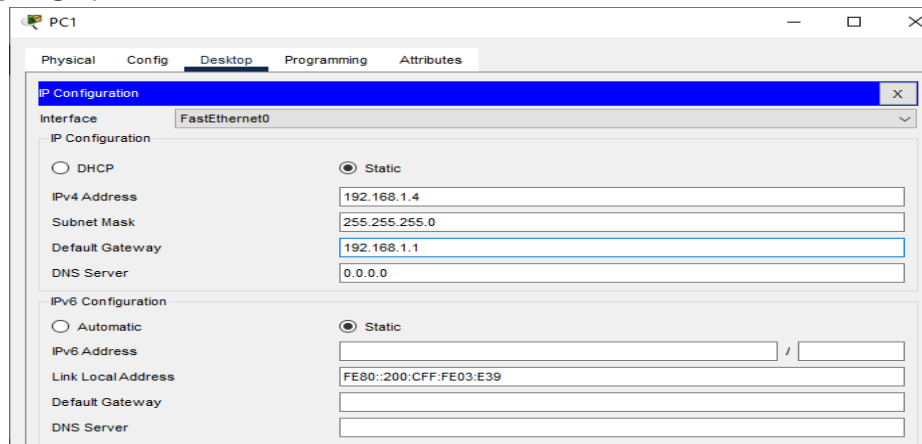

Configure the Server:

Configure PC0:

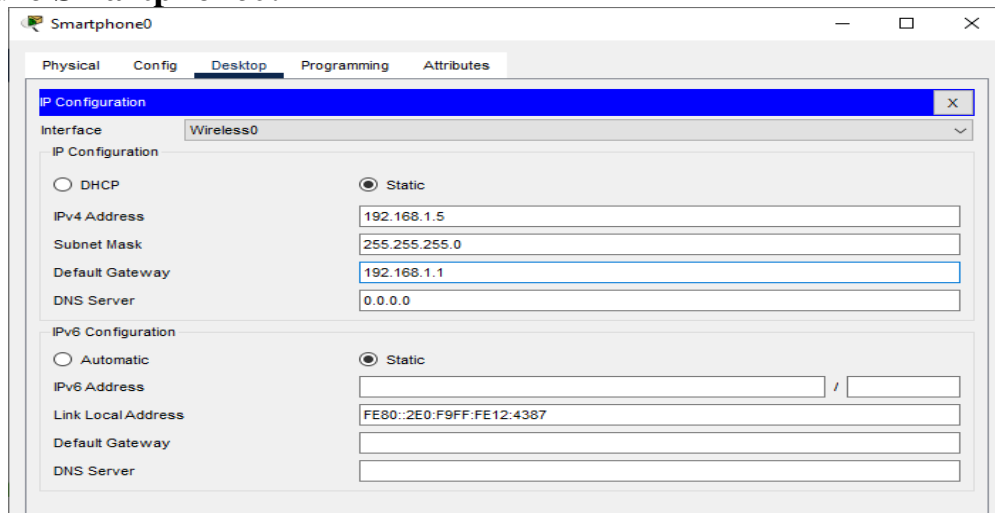

Configure PC1:

The screenshot shows the 'PC1' configuration window with the 'Desktop' tab selected. The 'IP Configuration' section is expanded, showing settings for the 'FastEthernet0' interface. The 'Static' radio button is selected under 'IP Configuration'. The fields are filled with the following values:

Field	Value
IPv4 Address	192.168.1.4
Subnet Mask	255.255.255.0
Default Gateway	192.168.1.1
DNS Server	0.0.0.0
IPv6 Configuration	Static
IPv6 Address	
Link Local Address	FE80::200:CFF:FE03:E39
Default Gateway	
DNS Server	

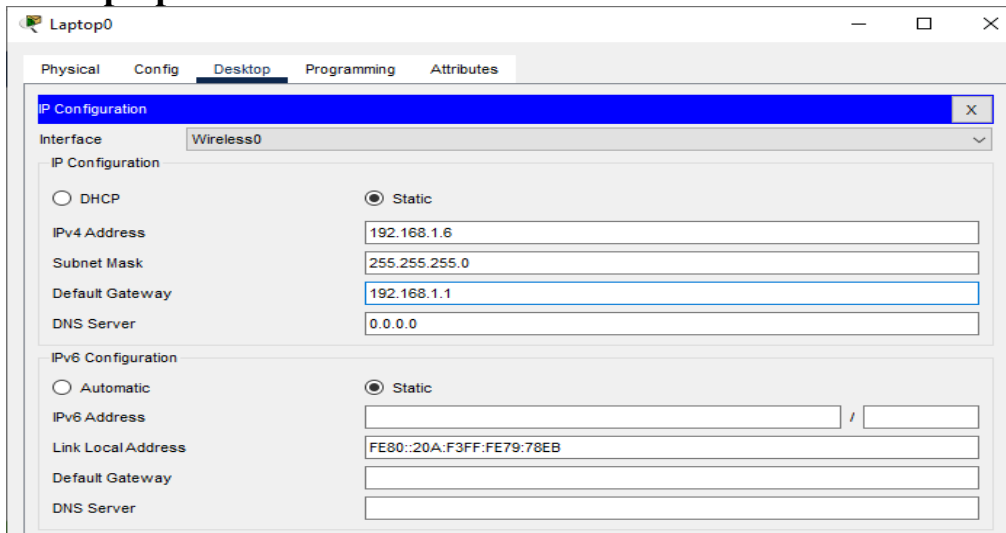

Configure Smartphone0:

The screenshot shows the 'Smartphone0' configuration window with the 'Desktop' tab selected. The 'IP Configuration' section is expanded, showing settings for the 'Wireless0' interface. The 'Static' radio button is selected under 'IP Configuration'. The fields are filled with the following values:

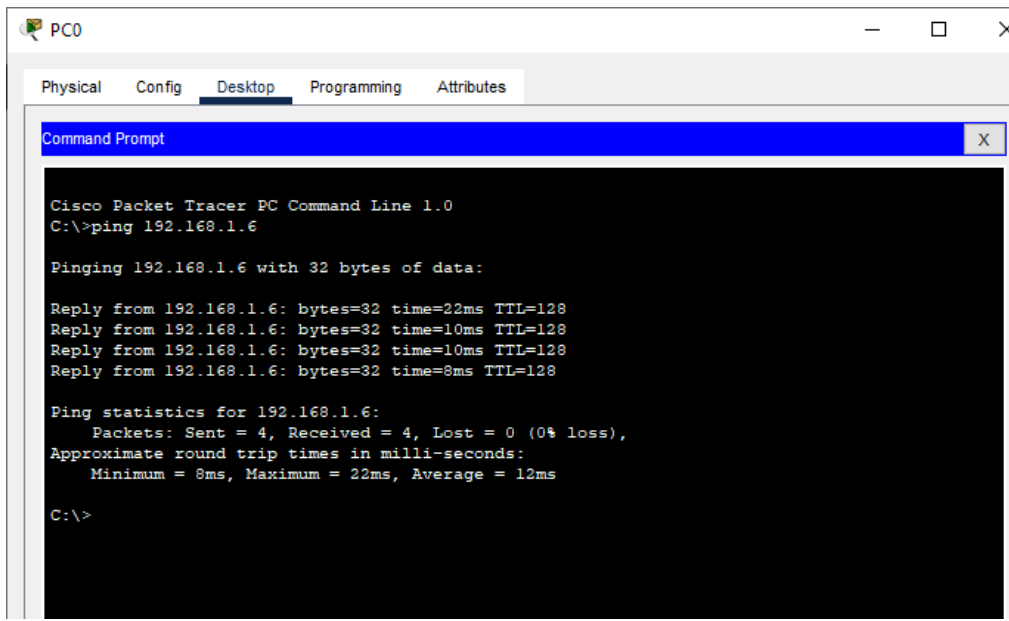

Field	Value
IPv4 Address	192.168.1.5
Subnet Mask	255.255.255.0
Default Gateway	192.168.1.1
DNS Server	0.0.0.0
IPv6 Configuration	Static
IPv6 Address	
Link Local Address	FE80::2E0:F9FF:FE12:4387
Default Gateway	
DNS Server	

Configure Laptop0:

The screenshot shows the 'Laptop0' configuration window with the 'Desktop' tab selected. The 'IP Configuration' section is expanded, showing settings for the 'Wireless0' interface. The 'Static' radio button is selected under 'IP Configuration'. The fields are filled with the following values:

Field	Value
IPv4 Address	192.168.1.6
Subnet Mask	255.255.255.0
Default Gateway	192.168.1.1
DNS Server	0.0.0.0
IPv6 Configuration	Static
IPv6 Address	
Link Local Address	FE80::20A:F3FF:FE79:78EB
Default Gateway	
DNS Server	

Checking the connectivity (pinging laptop0 from PC0):

The screenshot shows a Cisco Packet Tracer PC Command Line window for PC0. The window has tabs for Physical, Config, Desktop, Programming, and Attributes, with Desktop selected. The Command Prompt displays the output of a ping command to 192.168.1.6. The output shows four successful replies with varying times and a 0% loss rate.

```
Cisco Packet Tracer PC Command Line 1.0
C:\>ping 192.168.1.6

Pinging 192.168.1.6 with 32 bytes of data:

Reply from 192.168.1.6: bytes=32 time=22ms TTL=128
Reply from 192.168.1.6: bytes=32 time=10ms TTL=128
Reply from 192.168.1.6: bytes=32 time=10ms TTL=128
Reply from 192.168.1.6: bytes=32 time=8ms TTL=128

Ping statistics for 192.168.1.6:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
    Approximate round trip times in milli-seconds:
        Minimum = 8ms, Maximum = 22ms, Average = 12ms

C:\>
```

Similarly the ping message can be checked for all the devices

Result:

Hence the Connectivity of the network has been verified.

	LOOPBACK 30.1.1.1	30.0.0.0	255.0.0.0	0.255.255.255

Configuring PC0

The screenshot shows the configuration window for PC0. The 'Desktop' tab is selected. Under 'IP Configuration', the 'Interface' is 'FastEthernet0'. The 'Static' radio button is selected. The fields are filled with the following values:

Field	Value
IPv4 Address	192.168.1.2
Subnet Mask	255.255.255.0
Default Gateway	192.168.1.1
DNS Server	0.0.0.0

Below the IPv4 configuration, the 'IPv6 Configuration' section is visible. The 'Static' radio button is selected. The fields are filled with the following values:

Field	Value
IPv6 Address	
Link Local Address	FE80::2D0:D3FF:FE0A:1A
Default Gateway	
DNS Server	

Configuring PC1

The screenshot shows the configuration window for PC1. The 'Desktop' tab is selected. Under 'IP Configuration', the 'Interface' is 'FastEthernet0'. The 'Static' radio button is selected. The fields are filled with the following values:

Field	Value
IPv4 Address	192.168.4.2
Subnet Mask	255.255.255.0
Default Gateway	192.168.4.1
DNS Server	0.0.0.0

Below the IPv4 configuration, the 'IPv6 Configuration' section is visible. The 'Static' radio button is selected. The fields are filled with the following values:

Field	Value
IPv6 Address	
Link Local Address	FE80::2D0:D3FF:FE2A:A67
Default Gateway	
DNS Server	

Configuring Router0

```
Router>enable
Router#
Router#configure terminal
Router(config)#
Router(config)#interface gigabitEthernet 0/0
Router(config-if)#
Router(config-if)#ip address 192.168.1.1 255.255.255.0
Router(config-if)#no shutdown
Router(config-if)#exit
Router(config)#
Router(config)#interface gigabitEthernet 0/1
Router(config-if)#
Router(config-if)#ip address 192.168.2.1 255.255.255.0
Router(config-if)#no shutdown
Router(config-if)#exit
Router(config)#
Router(config)#interface loopback 0
Router(config-if)#
Router(config-if)#ip address 10.1.1.1 255.0.0.0
Router(config-if)#no shutdown
Router(config-if)#exit
Router(config)#
```

Configuring Router1

```
Router>enable
Router#
Router#configure terminal
Router(config)#
Router(config)#interface gigabitEthernet 0/0
Router(config-if)#
Router(config-if)#ip address 192.168.2.2 255.255.255.0
Router(config-if)#no shutdown
Router(config-if)#exit
Router(config)#
Router(config)#interface gigabitEthernet 0/1
Router(config-if)#
Router(config-if)#ip address 192.168.3.1 255.255.255.0
Router(config-if)#no shutdown
Router(config-if)#exit
Router(config)#
Router(config)#interface loopback 0
Router(config-if)#
Router(config-if)#ip address 10.1.1.1 255.0.0.0
Router(config-if)#no shutdown
Router(config-if)#exit
Router(config)#
Router(config)#interface loopback 0
Router(config-if)#
Router(config-if)#ip address 20.1.1.1 255.0.0.0
Router(config-if)#no shutdown
Router(config-if)#exit
Router(config)#
```

Configuring Router2

```
Router>enable
Router#
Router#configure terminal
Router(config)#
Router(config)#interface gigabitEthernet 0/0
Router(config-if)#
Router(config-if)#ip address 192.168.3.2 255.255.255.0
Router(config-if)#no shutdown
Router(config-if)#
Router(config-if)#exit
Router(config)#
Router(config)#interface gigabitEthernet 0/1
Router(config-if)#
Router(config-if)#ip address 192.168.4.1 255.255.255.0
Router(config-if)#no shutdown
Router(config-if)#exit
Router(config)#

Router(config)#interface loopback 0
Router(config-if)#
Router(config-if)#ip address 10.1.1.1 255.0.0.0
Router(config-if)#no shutdown
Router(config-if)#exit
Router(config)#
```

Configuring Router0 for OSPF

```
Router(config)#
Router(config)#router ospf 1
Router(config-router)#
Router(config-router)#network 192.168.1.0 255.255.255.0 area 0
Router(config-router)#network 192.168.2.0 255.255.255.0 area 0
Router(config-router)#exit
```

Configuring Router1 for OSPF

```
Router(config)#
Router(config)#router ospf 1
Router(config-router)#
Router(config-router)#network 192.168.2.0 255.255.255.0 area 0
Router(config-router)#network 192.168.3.0 255.255.255.0 area 1
Router(config-router)#exit
```

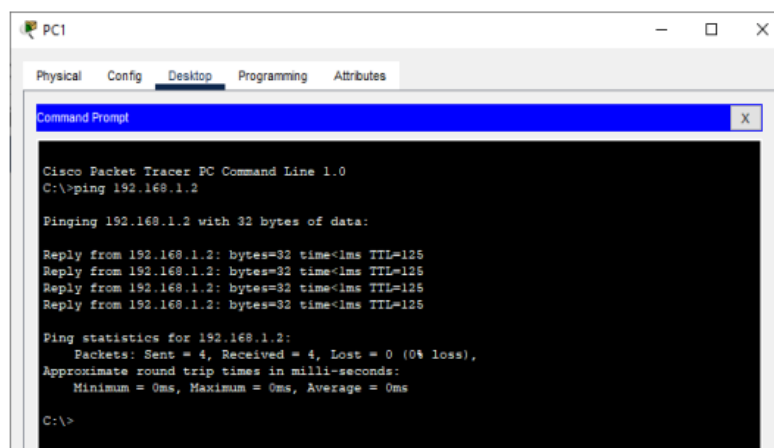

Configuring Router2 for OSPF

```
Router(config)#  
Router(config)#router ospf 1  
Router(config-router)#  
Router(config-router)#network 192.168.3.0 255.255.255.0 area 1  
Router(config-router)#network 192.168.4.0 255.255.255.0 area 1  
Router(config-router)#exit
```

Verify the connectivity (ping PC1 from PC0)

Verify the connectivity (ping PC0 from PC1)

Hence OSPF with Multiple Areas (area 0 and area 1) was successfully configured and verified

Scan the following

video demonstration
of the practical
OSPF with Multiple
Areas

Practical No 8

Aim: Using Packet Tracer, create a network with three routers with BGP and each router associated network will have minimum three PC and show Connectivity

Theory:

Border Gateway Protocol (BGP) is used to Exchange routing information for the internet and is the protocol used between ISP which are different Autonomous Systems (AS).

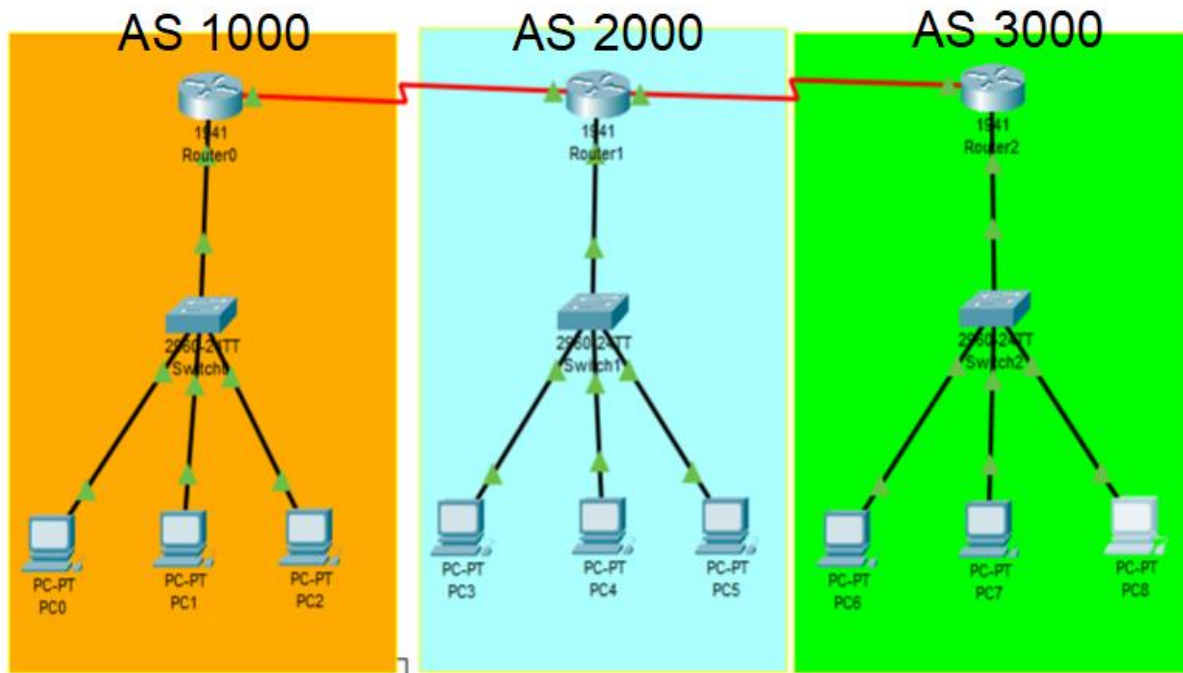

The protocol can connect together any internetwork of autonomous system using an arbitrary topology. The only requirement is that each AS have at least one router that is able to run BGP and that is router connect to at least one other AS's BGP router.

BGP's main function is to exchange network reach-ability information with other BGP systems.

Characteristics of Border Gateway Protocol (BGP):

- a) The main role of BGP is to provide communication between two autonomous systems.
- b) BGP supports Next-Hop Paradigm.
- c) Coordination among multiple BGP speakers within the AS (Autonomous System).
- d) BGP advertisement also include path information, along with the reachable destination and next destination pair.
- e) BGP can implement policies that can be configured by the administrator.
- f) BGP runs Over TCP.
- g) BGP conserve network Bandwidth.
- h) BGP supports CIDR.
- i) BGP also supports Security

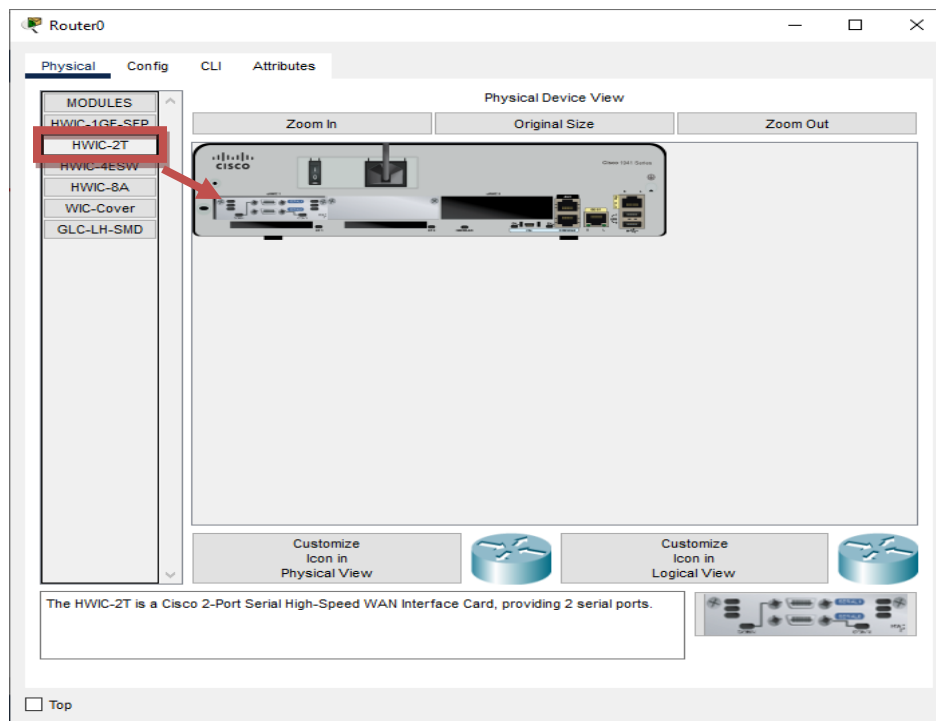

We use the following topology for the present case

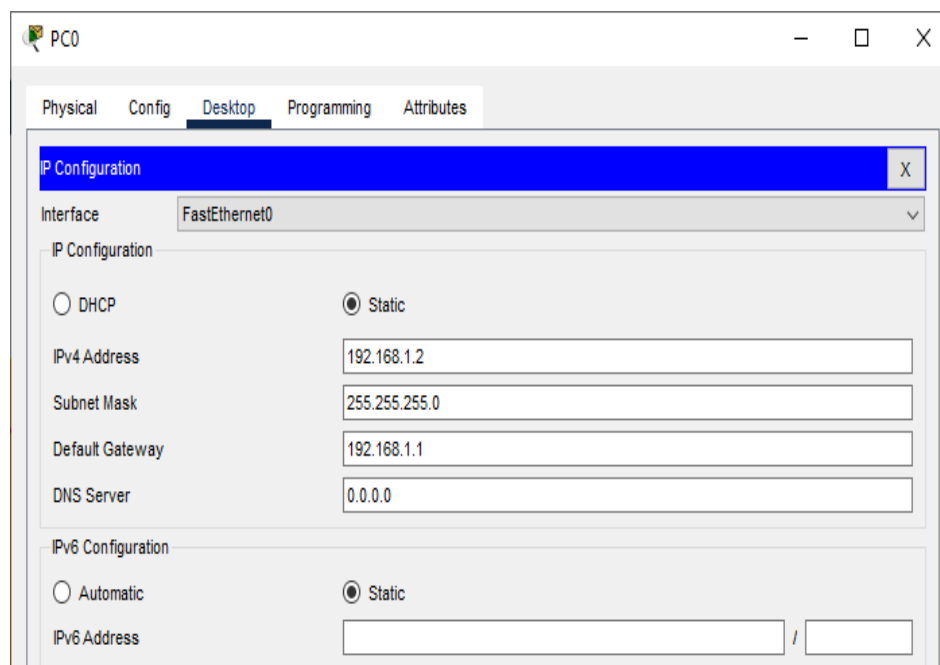

We configure the above network using the following IP addresses

Host	Interface	IP address	Network Address	Default Gateway
Router 0 AS 1000	G0/0	192.168.1.1	192.168.1.0	
	S0/1/0	10.0.0.1	10.0.0.0	
Router 1 AS 2000	G0/0	192.168.2.1	192.168.2.0	
	S0/1/0	10.0.0.2	10.0.0.0	
	S0/1/1	20.0.0.1	20.0.0.0	
Router 2 AS 3000	G0/0	192.168.3.1	192.168.3.0	
	S0/1/1	20.0.0.2	20.0.0.0	
PC0	FastEthernet0	192.168.1.2	192.168.1.0	192.168.1.1
PC1	FastEthernet0	192.168.1.3		
PC2	FastEthernet0	192.168.1.4		
PC3	FastEthernet0	192.168.2.2	192.168.2.0	192.168.2.1
PC4	FastEthernet0	192.168.2.3		
PC5	FastEthernet0	192.168.2.4		
PC6	FastEthernet0	192.168.3.2	192.168.3.0	192.168.3.1
PC7	FastEthernet0	192.168.3.3		
PC8	FastEthernet0	192.168.3.4		

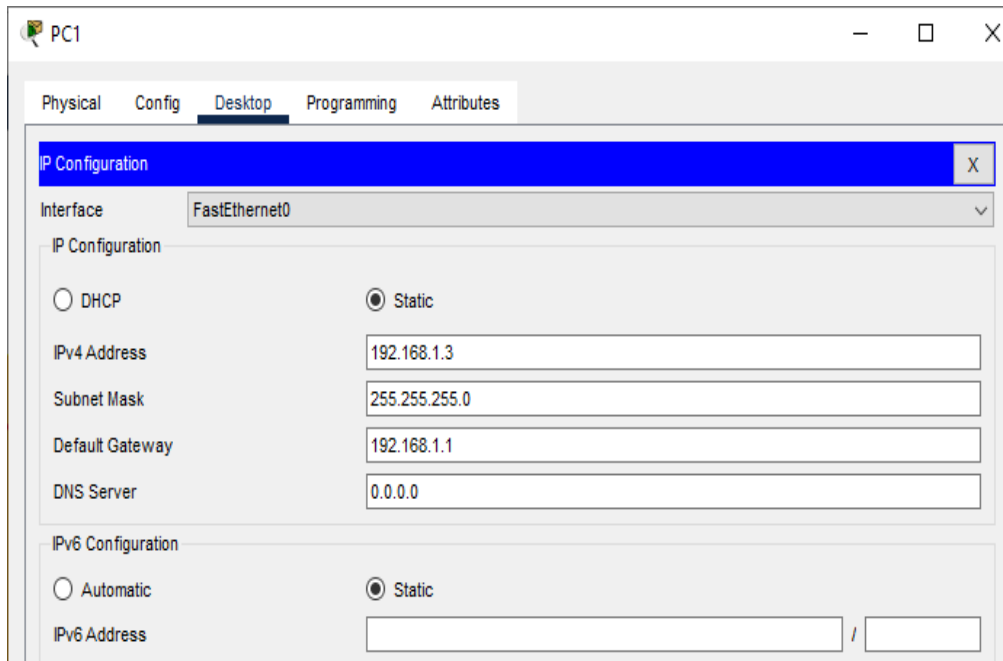

Adding Serial Interface in each Router

Configuring PC0:

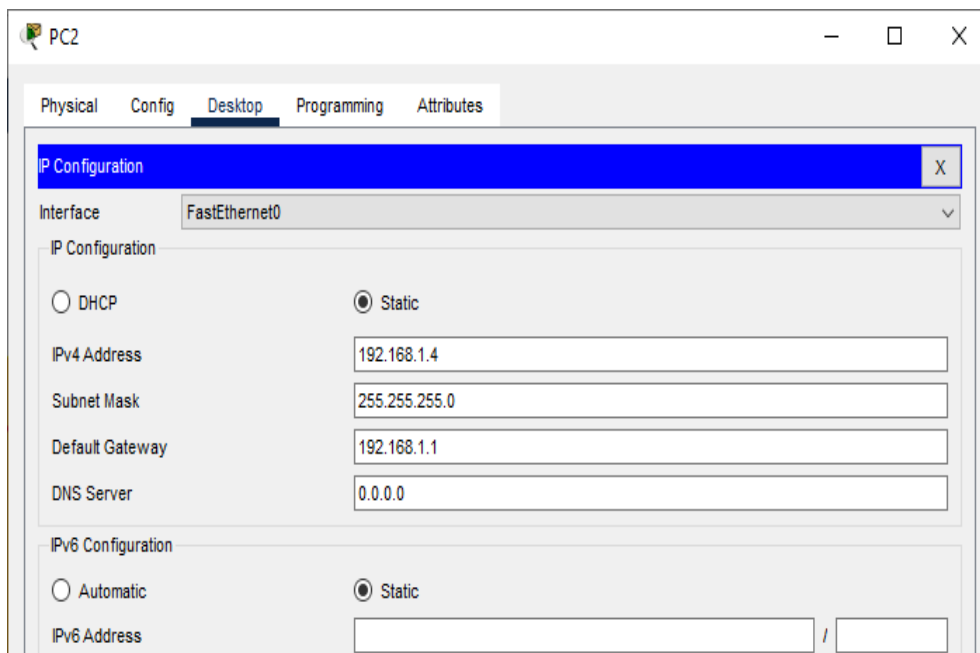

Configuring PC1:

The screenshot shows the 'PC1' configuration window with the 'Desktop' tab selected. The 'IP Configuration' section is highlighted in blue. The 'Interface' dropdown is set to 'FastEthernet0'. Under 'IP Configuration', the 'Static' radio button is selected. The fields are filled with: IPv4 Address: 192.168.1.3, Subnet Mask: 255.255.255.0, Default Gateway: 192.168.1.1, and DNS Server: 0.0.0.0. The 'IPv6 Configuration' section is collapsed, showing 'Automatic' and 'Static' radio buttons, with the 'Static' button selected and an empty IPv6 Address field.

Field	Value
Interface	FastEthernet0
IP Configuration	Static
IPv4 Address	192.168.1.3
Subnet Mask	255.255.255.0
Default Gateway	192.168.1.1
DNS Server	0.0.0.0
IPv6 Configuration	Static
IPv6 Address	

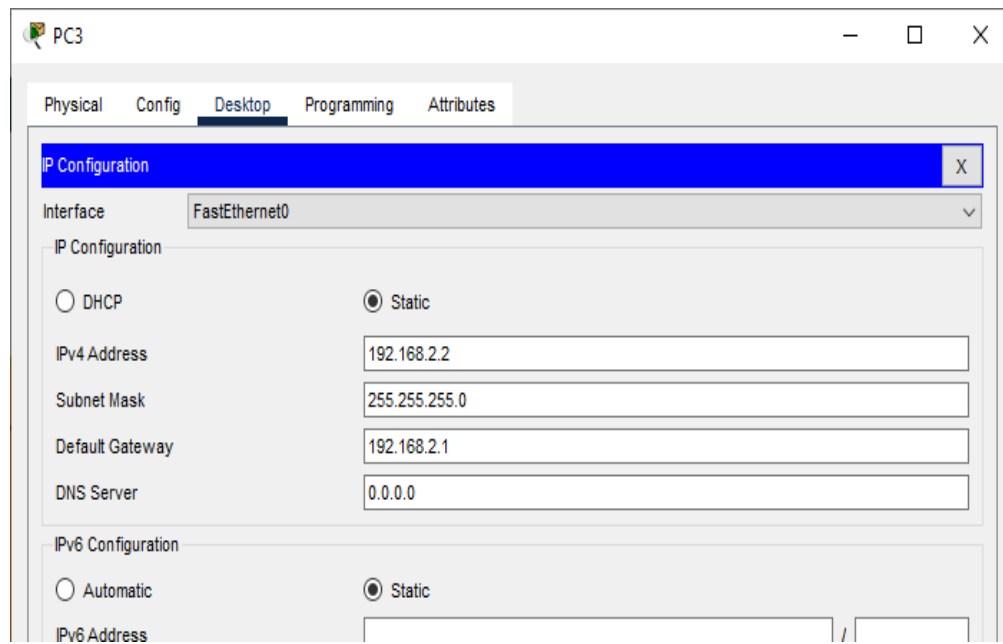

Configuring PC2:

The screenshot shows the 'PC2' configuration window with the 'Desktop' tab selected. The 'IP Configuration' section is highlighted in blue. The 'Interface' dropdown is set to 'FastEthernet0'. Under 'IP Configuration', the 'Static' radio button is selected. The fields are filled with: IPv4 Address: 192.168.1.4, Subnet Mask: 255.255.255.0, Default Gateway: 192.168.1.1, and DNS Server: 0.0.0.0. The 'IPv6 Configuration' section is collapsed, showing 'Automatic' and 'Static' radio buttons, with the 'Static' button selected and an empty IPv6 Address field.

Field	Value
Interface	FastEthernet0
IP Configuration	Static
IPv4 Address	192.168.1.4
Subnet Mask	255.255.255.0
Default Gateway	192.168.1.1
DNS Server	0.0.0.0
IPv6 Configuration	Static
IPv6 Address	

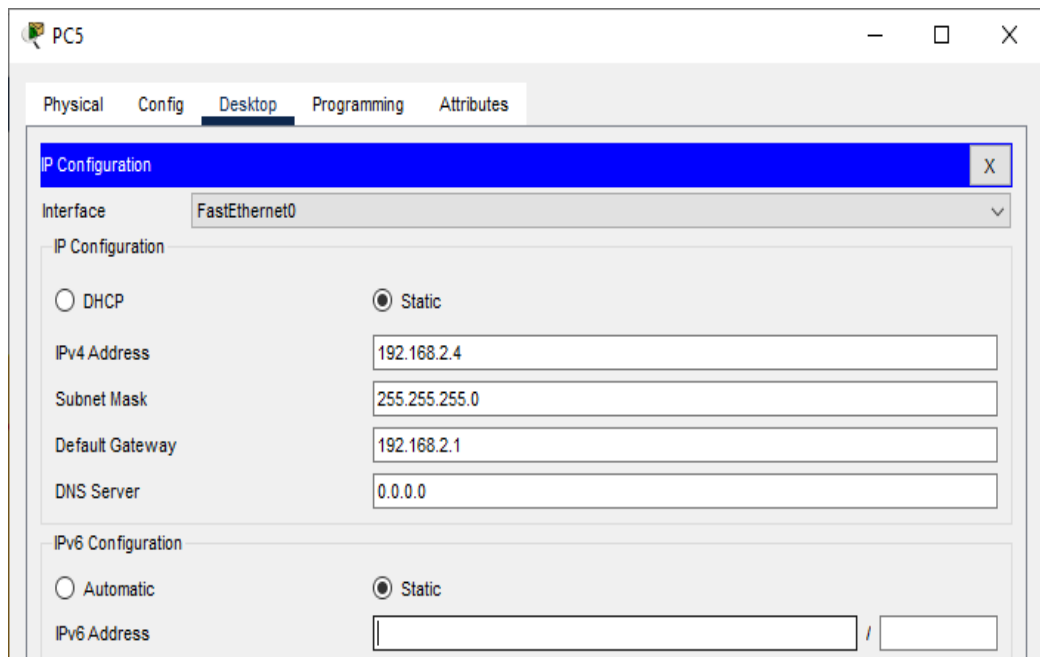

Configuring PC3:

Configuring PC4:

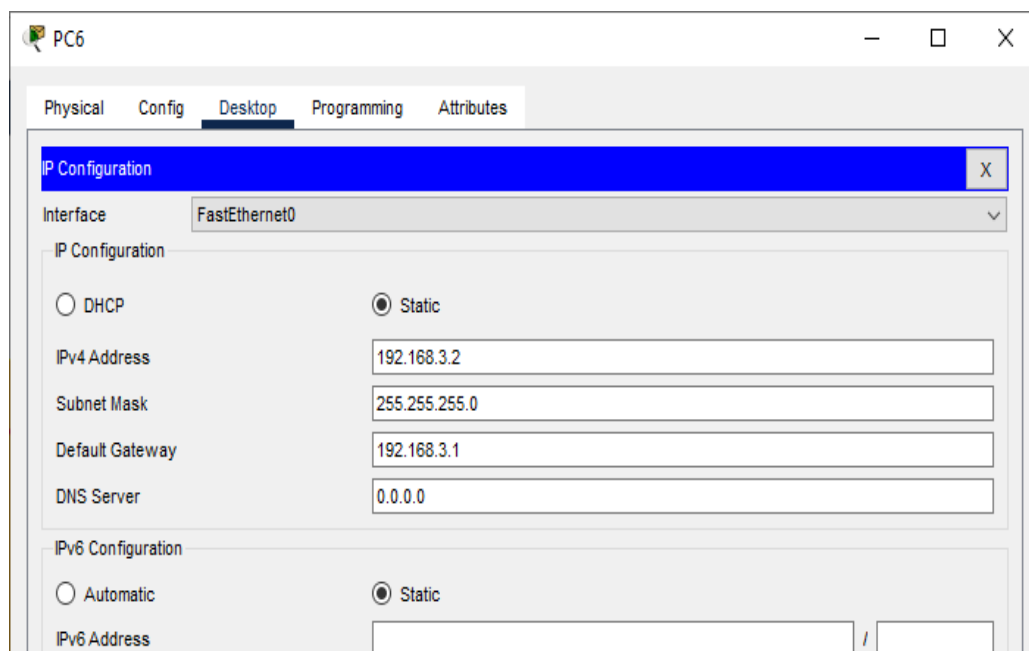

Configuring PC5:

The screenshot shows the configuration window for PC5. The 'Desktop' tab is selected. Under 'IP Configuration', the 'Static' radio button is chosen. The IPv4 Address is set to 192.168.2.4, Subnet Mask to 255.255.255.0, Default Gateway to 192.168.2.1, and DNS Server to 0.0.0.0. The IPv6 Configuration section shows the 'Static' radio button selected, but the IPv6 Address field is empty.

Field	Value
Interface	FastEthernet0
IP Configuration	Static
IPv4 Address	192.168.2.4
Subnet Mask	255.255.255.0
Default Gateway	192.168.2.1
DNS Server	0.0.0.0
IPv6 Configuration	Static
IPv6 Address	

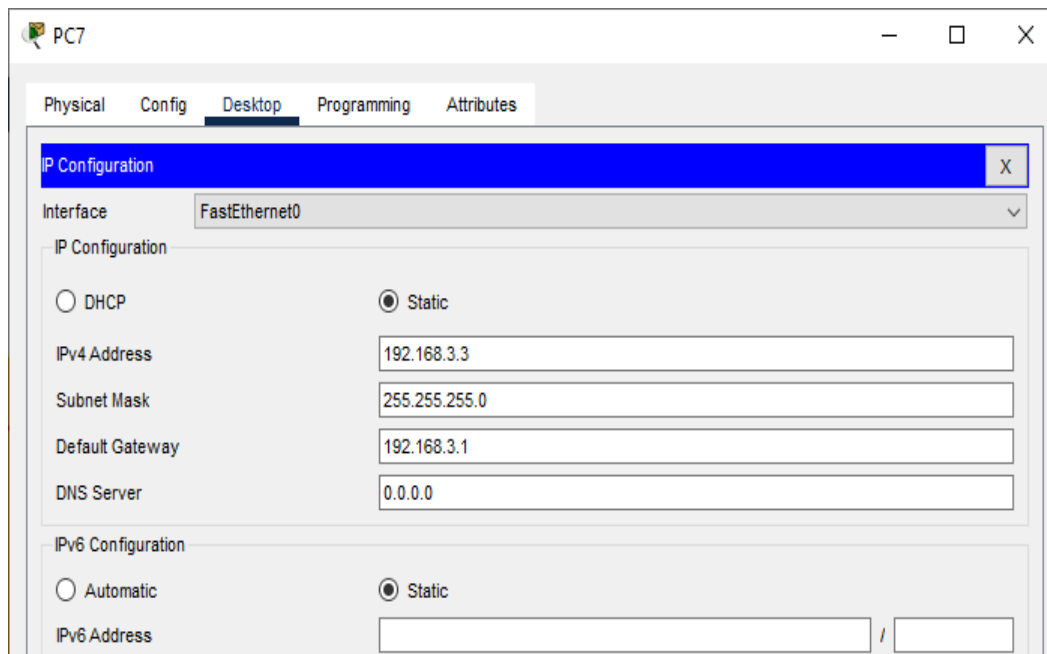

Configuring PC6:

The screenshot shows the configuration window for PC6. The 'Desktop' tab is selected. Under 'IP Configuration', the 'Static' radio button is chosen. The IPv4 Address is set to 192.168.3.2, Subnet Mask to 255.255.255.0, Default Gateway to 192.168.3.1, and DNS Server to 0.0.0.0. The IPv6 Configuration section shows the 'Static' radio button selected, but the IPv6 Address field is empty.

Field	Value
Interface	FastEthernet0
IP Configuration	Static
IPv4 Address	192.168.3.2
Subnet Mask	255.255.255.0
Default Gateway	192.168.3.1
DNS Server	0.0.0.0
IPv6 Configuration	Static
IPv6 Address	

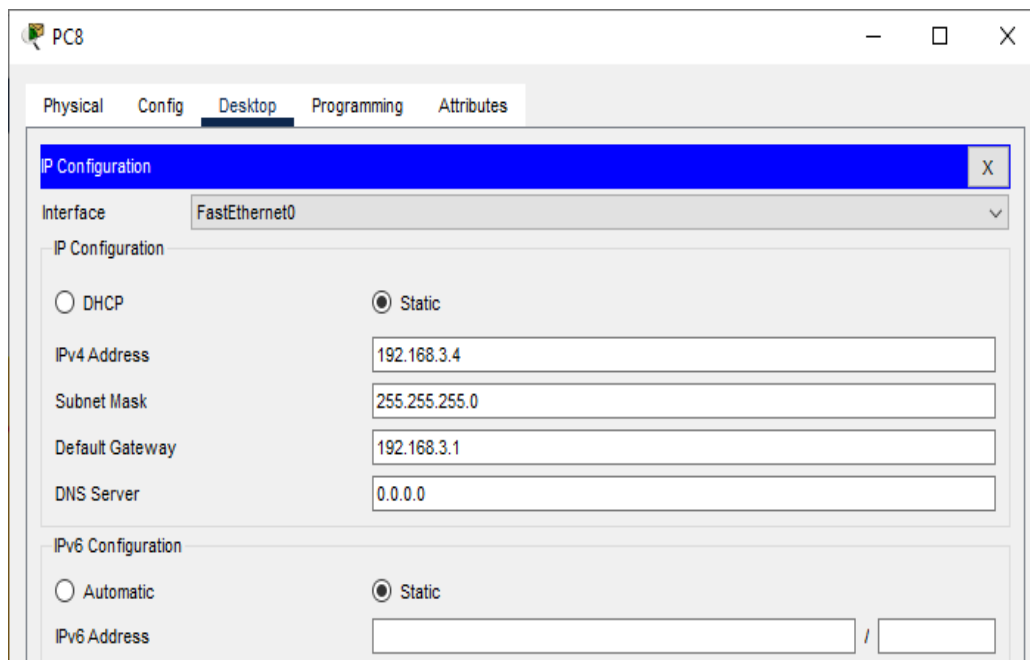

Configuring PC7:

The screenshot shows the configuration window for PC7. The 'Desktop' tab is selected, and the 'IP Configuration' section is highlighted. The interface is set to 'FastEthernet0'. Under 'IP Configuration', the 'Static' radio button is selected. The IPv4 Address is set to 192.168.3.3, Subnet Mask is 255.255.255.0, Default Gateway is 192.168.3.1, and DNS Server is 0.0.0.0. Under 'IPv6 Configuration', the 'Static' radio button is also selected, and the IPv6 Address field is empty.

Field	Value
Interface	FastEthernet0
IP Configuration	
DHCP	<input type="radio"/>
Static	<input checked="" type="radio"/>
IPv4 Address	192.168.3.3
Subnet Mask	255.255.255.0
Default Gateway	192.168.3.1
DNS Server	0.0.0.0
IPv6 Configuration	
Automatic	<input type="radio"/>
Static	<input checked="" type="radio"/>
IPv6 Address	

Configuring PC8:

The screenshot shows the configuration window for PC8. The 'Desktop' tab is selected, and the 'IP Configuration' section is highlighted. The interface is set to 'FastEthernet0'. Under 'IP Configuration', the 'Static' radio button is selected. The IPv4 Address is set to 192.168.3.4, Subnet Mask is 255.255.255.0, Default Gateway is 192.168.3.1, and DNS Server is 0.0.0.0. Under 'IPv6 Configuration', the 'Static' radio button is also selected, and the IPv6 Address field is empty.

Field	Value
Interface	FastEthernet0
IP Configuration	
DHCP	<input type="radio"/>
Static	<input checked="" type="radio"/>
IPv4 Address	192.168.3.4
Subnet Mask	255.255.255.0
Default Gateway	192.168.3.1
DNS Server	0.0.0.0
IPv6 Configuration	
Automatic	<input type="radio"/>
Static	<input checked="" type="radio"/>
IPv6 Address	

Configuring IP addresses on Router 0

i) Interface G0/0

The screenshot shows the configuration window for Router0, specifically the 'Config' tab for the GigabitEthernet0/0 interface. The left sidebar lists various configuration categories: GLOBAL, Settings, Algorithm Settings, ROUTING, Static, RIP, SWITCHING, VLAN Database, and INTERFACE. Under the INTERFACE category, GigabitEthernet0/0 is selected. The main configuration area for GigabitEthernet0/0 includes the following settings:

- Port Status: ☒ On
- Bandwidth: ☒ 1000 Mbps, ☐ 100 Mbps, ☐ 10 Mbps, ☒ Auto
- Duplex: ☒ Half Duplex, ☐ Full Duplex, ☒ Auto
- MAC Address: 00D0.D398.4601
- IP Configuration:
 - IPv4 Address: 192.168.1.1
 - Subnet Mask: 255.255.255.0
- Tx Ring Limit: 10

ii) Interface S0/1/0

The screenshot shows the configuration window for Router0, specifically the 'Config' tab for the Serial0/1/0 interface. The left sidebar lists various configuration categories: GLOBAL, Settings, Algorithm Settings, ROUTING, Static, RIP, SWITCHING, VLAN Database, and INTERFACE. Under the INTERFACE category, Serial0/1/0 is selected. The main configuration area for Serial0/1/0 includes the following settings:

- Port Status: ☒ On
- Duplex: ☒ Full Duplex
- Clock Rate: 1200
- IP Configuration:
 - IPv4 Address: 10.0.0.1
 - Subnet Mask: 255.0.0.0
- Tx Ring Limit: 10

Configuring IP addresses on Router 1

i) Interface G0/0

The screenshot shows the configuration window for Router1, specifically for the GigabitEthernet0/0 interface. The left sidebar shows the configuration tree with 'INTERFACE' expanded and 'GigabitEthernet0/0' selected. The main panel displays the following settings:

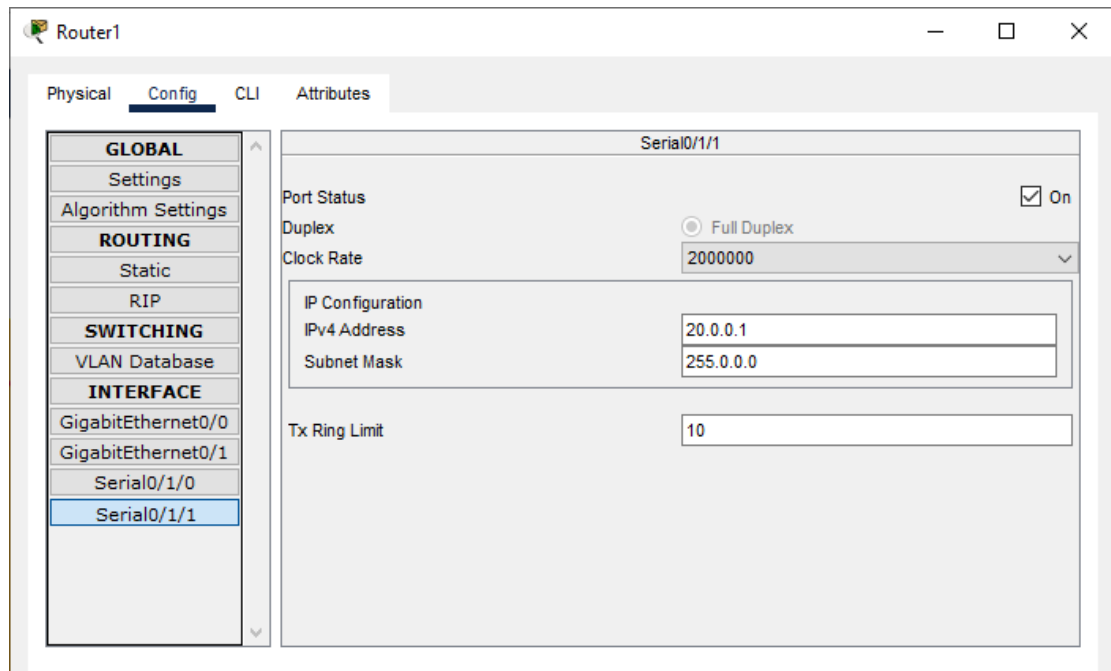

- Port Status:** ☒ On
- Bandwidth:** ☒ 1000 Mbps ☐ 100 Mbps ☐ 10 Mbps ☒ Auto
- Duplex:** ☒ Half Duplex ☐ Full Duplex ☒ Auto
- MAC Address:** 0090.2B5B.9E01
- IP Configuration:**
 - IPv4 Address:** 192.168.2.1
 - Subnet Mask:** 255.255.255.0
- Tx Ring Limit:** 10

ii) Interface S0/1/0

The screenshot shows the configuration window for Router1, specifically for the Serial0/1/0 interface. The left sidebar shows the configuration tree with 'INTERFACE' expanded and 'Serial0/1/0' selected. The main panel displays the following settings:

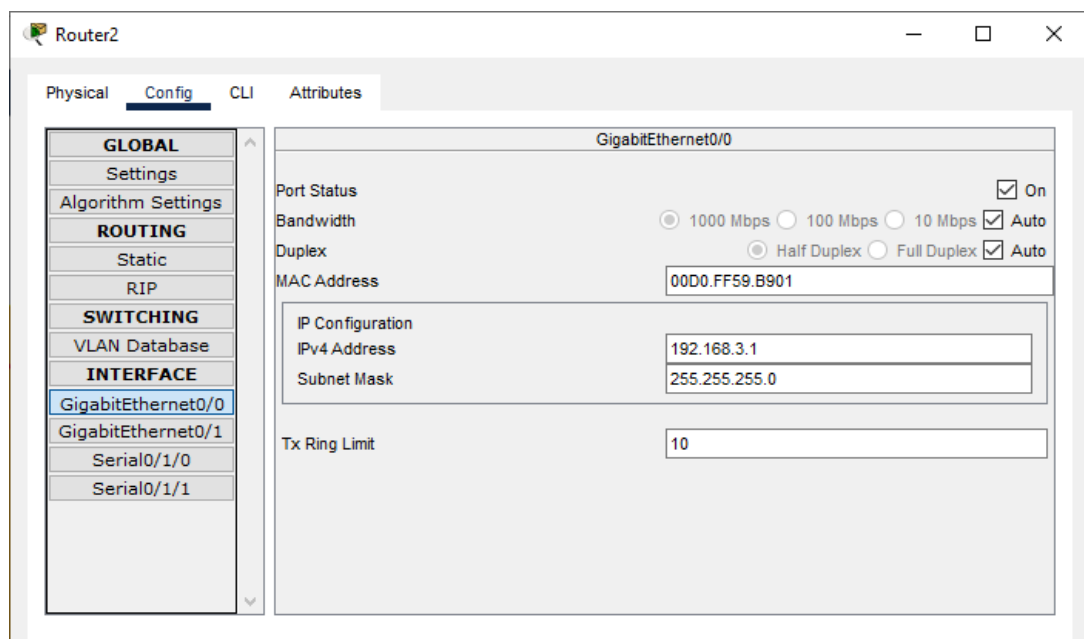

- Port Status:** ☒ On
- Duplex:** ☒ Full Duplex
- Clock Rate:** 2000000
- IP Configuration:**
 - IPv4 Address:** 10.0.0.2
 - Subnet Mask:** 255.0.0.0
- Tx Ring Limit:** 10

iii) Interface S0/1/1

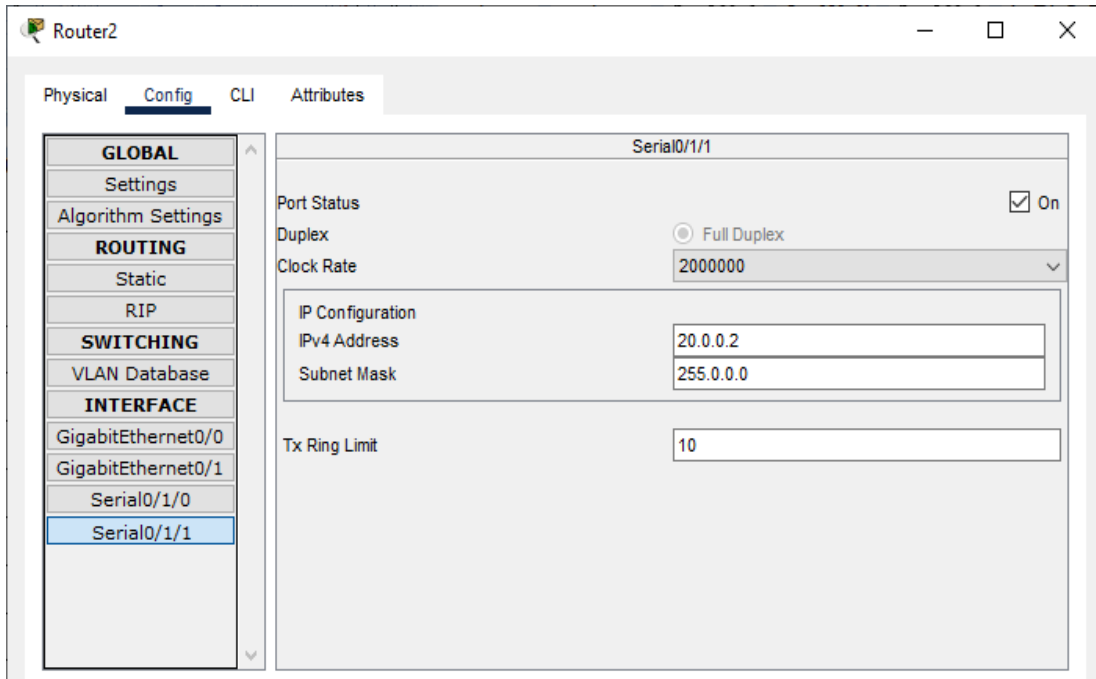

Configuring IP addresses on Router 2

i) Interface G0/0

ii) Interface S0/1/1

**Configuring Router 0 for BGP (using the CLI mode)**

```
Router>enable
Router#configure terminal
Router(config)#
Router(config)#router bgp 1000
Router(config-router)#
Router(config-router)#network 10.0.0.0
Router(config-router)#network 192.168.1.0
Router(config-router)#neighbor 10.0.0.2 remote-as 2000
```

Configuring Router 1 for BGP (using the CLI mode)

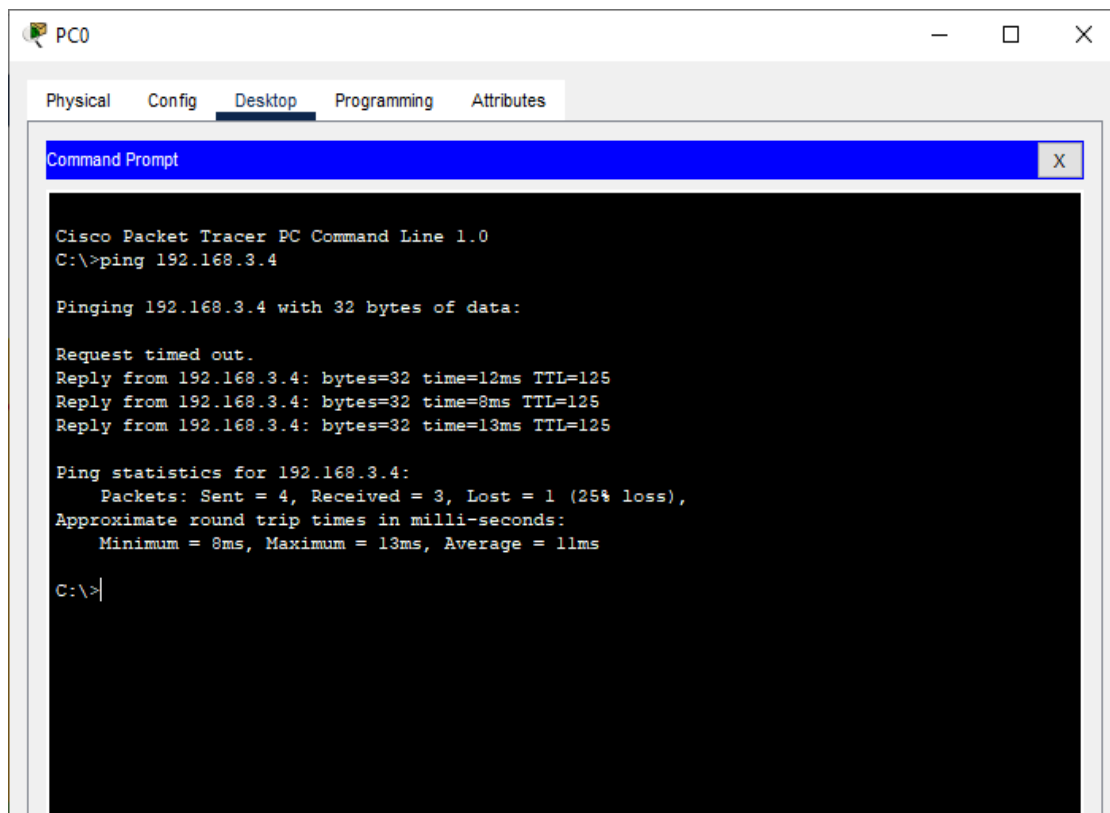

```
Router>enable
Router#configure terminal
Router(config)#
Router(config)#router bgp 2000
Router(config-router)#network 10.0.0.0
Router(config-router)#network 20.0.0.0
Router(config-router)#network 192.168.2.0
Router(config-router)#neighbor 10.0.0.1 remote-as 1000
Router(config-router)#neighbor 20.0.0.2 remote-as 3000
```

Configuring Router 2 for BGP (using the CLI mode)

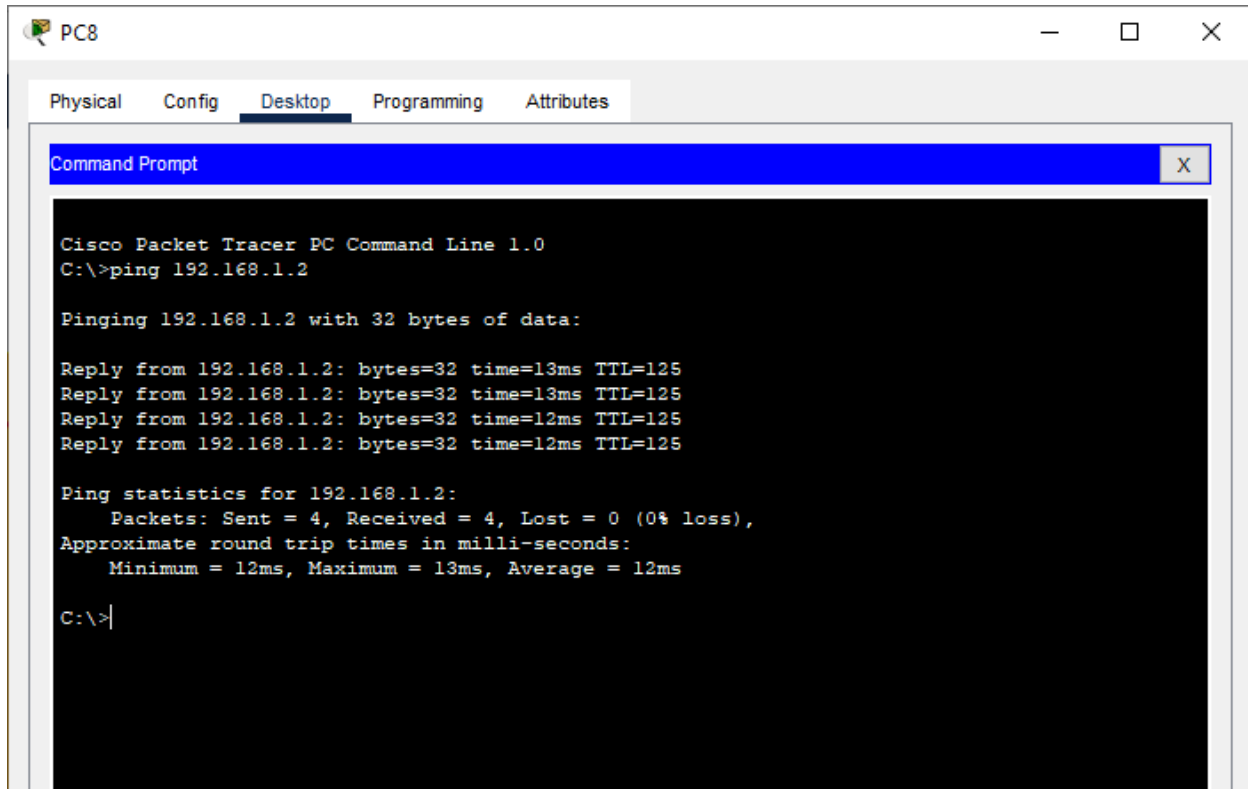

```
Router>enable
Router#configure terminal
Router(config)#
Router(config)#router bgp 3000
Router(config-router)#
Router(config-router)#network 20.0.0.0
Router(config-router)#network 192.168.3.0
Router(config-router)#neighbor 20.0.0.1 remote-as 2000
```

Checking the connectivity by using the ping command

- i) Pinging PC8 (ip address 192.168.3.4) from PC1

ii) Pinging PC0 (ip address 192.168.1.2) from PC8

```
Cisco Packet Tracer PC Command Line 1.0
C:\>ping 192.168.1.2

Pinging 192.168.1.2 with 32 bytes of data:

Reply from 192.168.1.2: bytes=32 time=13ms TTL=125
Reply from 192.168.1.2: bytes=32 time=13ms TTL=125
Reply from 192.168.1.2: bytes=32 time=12ms TTL=125
Reply from 192.168.1.2: bytes=32 time=12ms TTL=125

Ping statistics for 192.168.1.2:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
    Approximate round trip times in milli-seconds:
        Minimum = 12ms, Maximum = 13ms, Average = 12ms

C:\>
```

Result:

Hence the BGP has been studied and verified through the given network
